

Part-B

Q#1 Flowchart:

Pseudocode: (2)

```
1. Start
2. current-floor ← 0
3. input N
4. For i ← 1 to N do
5.     input seqFloor
6.     if seq-floor > current-floor then
7.         Print "moving up"
8.     else
9.         Print "Doors opening"
10.    End if
11.    currentFloor ← seqFloor
12. End For
14. End
```

PAC - Chest (2)

Module	Description	Function
1. Main Program	Handles the loop for N request and calls other modules	- Read N - Call Process
2. Process Req	Compares requested floor with current floor	$> \rightarrow m \cdot up$ $< \rightarrow m \cdot down$ $= \rightarrow d \cdot open$ - update current floor
3. Input validation	Ensure request is a valid floor no.	- Check range - if invalid, ask again

IPO - Chest :

Input	Process	Output
- N - List of Floor	- Set C.F = 0 - For each req: - validate input - Comp with C.F - Print message	M. up M. down - Door opening
